

Monitoring

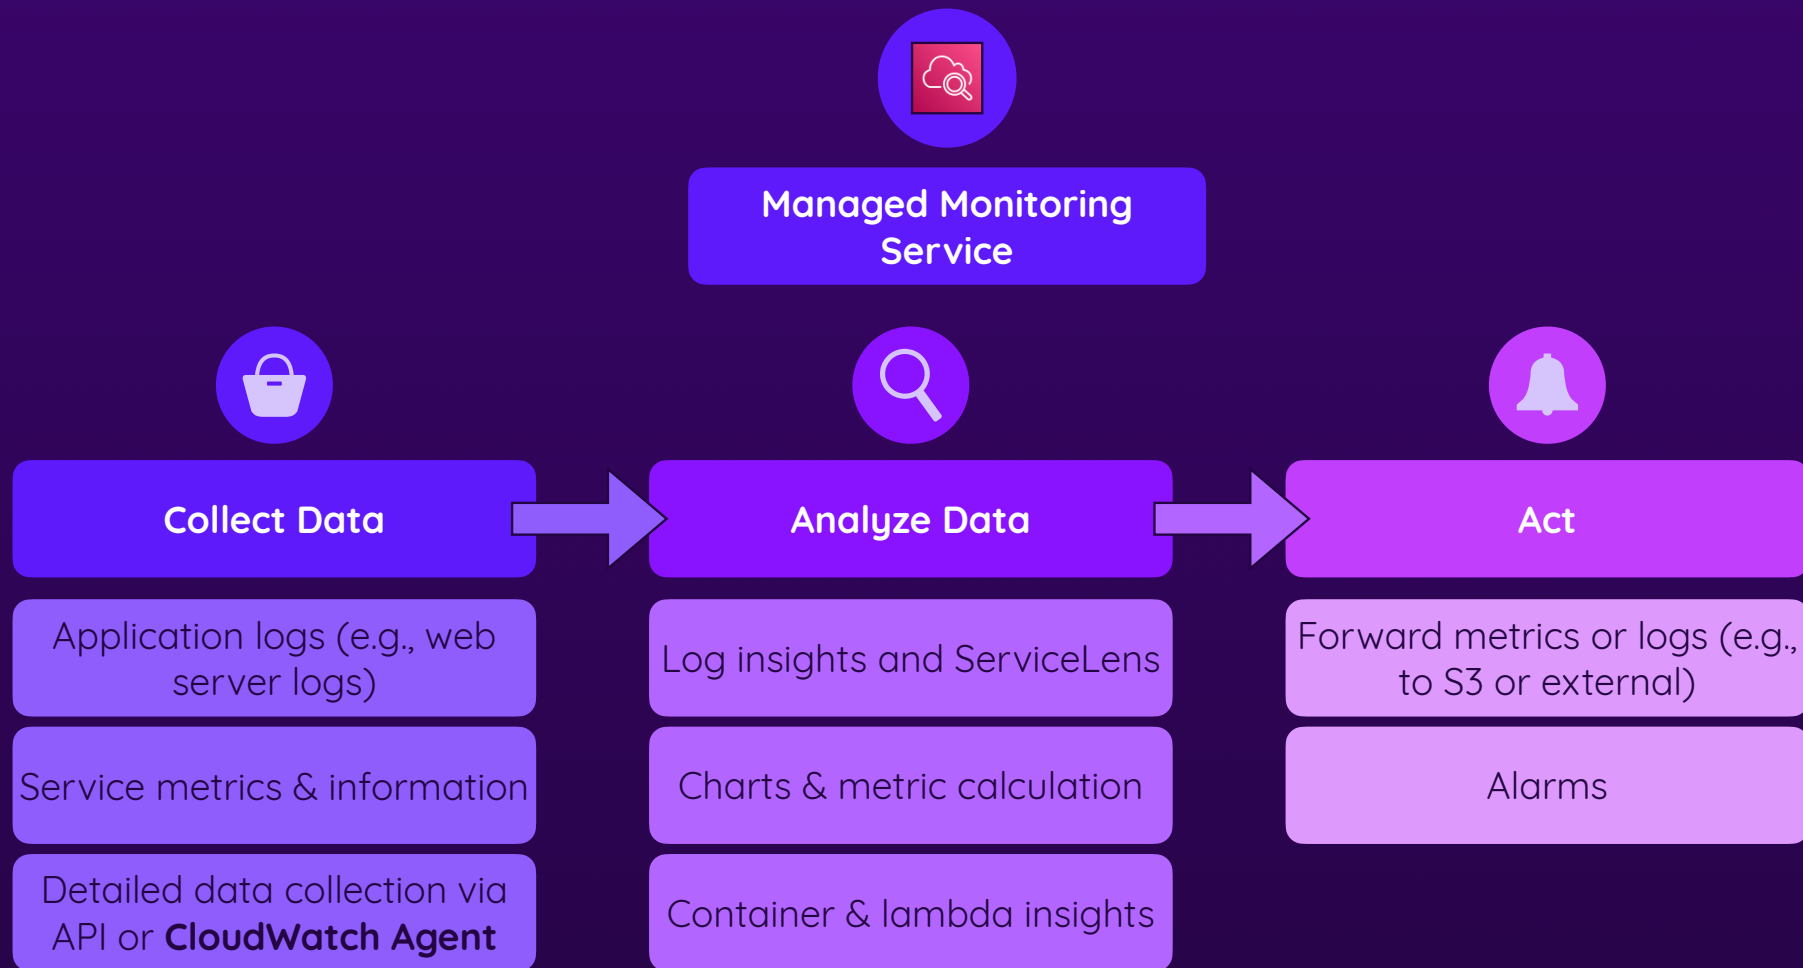

Keeping track of your services & applications

- ▶ Monitoring Goals & Requirements
- ▶ Understanding CloudWatch & More

Monitoring: What & Why?

Monitoring with CloudWatch

Get Alerted

Create CloudWatch Alerts

Select a Metric

e.g., avg. bytes stored in a bucket in 1 day

e.g., avg. cpu utilization on an EC2 instance in 5 minutes

Define Alert Conditions

e.g., > 5,000 bytes

e.g., > 80%

Define Alarm Action

e.g., send notification via SNS

e.g., trigger auto-scaling

Cross-Service Insights With XRay

In-app Request Flow Tracing

Prepare Apps For Tracing

Install daemon service in app environment

Save tracing events (e.g., handled requests, failures)

Daemon sends tracing event batches to AWS

Analyze Traces

View traffic flow across applications or services

Combine with other monitoring tools

Summary

Monitoring: What & Why?

Services & workflows might not always work as intended

You want to detect & solve problems as early as possible

Monitoring allows you to gain insights & solve problems

Alerts make sure that you get notified about issues early

CloudWatch

CloudWatch is AWS's key monitoring service

It collects data (logs, metrics) from other AWS services

You can create dashboards, chart metrics & perform analyses

XRays & other advanced monitoring features are offered

Monitoring Other Services

Default metrics or logs are collected by most services

Extra logging (paid) can be turned on for many services

CloudWatch Agent or XRay daemon offer more details
